Test	Result	N gene	ORF 1
RNA Analysis For Covid-19	<b>Negative</b>	-	-
PCR Sample : Naso / Oropharynx		-	-

## Comments:

Nucleic Acid Analysis: Detection by Real Time RT-PCR

Dear physician,

A "Positive" result indicates that Covid-19 RNA was detected and a "Negative" result indicates that Covid-19 RNA was not detected in the Naso/Oropharynx sample by RT-PCR method.

The result may be affected by the stage of the Covid-19 infection. If You have any sign or symptoms of Covid-19 infection, regardless of the test results, keep the quarantine and follow the protocols. Repeat the test after 72 hours if deemed necessary. Predictive value of the test depending on the stage of disease and quality of sampling is about 80%. We tested sample for all variants of Covid-19 Virus including Delta and Omicron.

If you have any further question please do not hesitate to contact us.
